Problem statement

The task is to write a command line application using C# that accepts input XML file and produces the expected XML file. To fetch the expected data, it's required to use Xpath and Regex libraries.
Output must contain Visual Studio solution, which builds the command line application.

Criteria for assessment have the following priorities:

1. Correctness
2. Quality
3. Time is taken to solve (the less the better)

The expected time to complete the assessment is 2 days, but it's not a hard limit, you may spend more if you need to.
